The **BERLOY** *Idea*

TO produce high-grade products only; to deal fairly with all; to render efficient service constantly; to improve business and factory systems; to better working conditions; to make buildings and their equipment more durable; to replace wood with permanent metal; to make the utmost of metal in the construction of buildings and equipment—that is the BERLOY idea.

The BERLOY idea is in fact an ideal and the name and the design combine to make a symbol representing that ideal.

As a protection to you and an inspiration to us, all products leaving our plant will be identified with the BERLOY symbol.

The responsibility of doing his part in the attainment of our ideal is placed on the shoulders of every man in the organization and according to his accomplishment he is judged, so when the stamp of approval—the BERLOY symbol—goes on our products it signifies to you that each of us has put his best into that which you receive.

The Berger Manufacturing Co.

BERLOY METAL CEILINGS

Art in Metal Ceilings

THE Berger Manufacturing Company was the first to conceive the idea of producing metal ceilings which could be definitely classified as to style or period of decoration represented; correct, harmonious, and appropriate throughout, yet embodying the flexibility and wide range of application which is such an important characteristic of Metal Ceilings.

Metal ceilings which had been previously produced were but a conglomerate mixture of incongruous styles. That objectionable characteristic was effectually removed when The Berger Manufacturing Company developed and placed upon the market their now well-known line of Berloy Metal Ceilings.

Improvement

(Bead and Button Construction)

The bead has been enlarged and lengthened and shaped to a half oval, adding strength and rigidity, as well as reinforcing the ceiling plates at joints. The top of the nailing button being depressed or countersunk, forms a self-centering, self-guiding and never-slip nailing point, acts as a guide for the erector in placing nail in the correct position and prevents slipping while driving, increasing the speed and efficiency of the ceiling erector.

Facilities

Although our equipment has always been the best that the mechanical world could produce we recently designed and made and installed a large number of special presses and new equipment in order to assure even a better product than has been possible heretofore. The beads and buttons are stamped and repressed in one operation, absolutely true and perfect, each piece made with

absolute precision and accuracy, being an exact fac-simile of the next in length, in width, and in every detail of ornamentation. Every bead and button fitting accurately over underlapping bead and button, makes a tight and perfect fitting joint, thereby eliminating the calking or tamping of joints, which has been a decidedly expensive factor in the cost of erection.

Advantages

These special features will reduce the cost of erecting at least 25 per cent., as well as assuring the owner and architect that Berloy Metal Ceilings cannot be installed other than in a thorough and workmanlike manner.

All units are carefully sheared and all panels and plates resquared on all sides.

Service

Ours is recognized in the trade as the largest sheet metal works in the world, in which every operation is conducted for the production of high-grade iron and steel sheets and the products made therefrom "from the ore to the store."

The capacity of our manufacturing plant and the fact that we operate our own complete steel and sheet mills enable us to offer our patrons service which cannot be excelled, and we are prepared to fill orders promptly, either from our main office or our branches where a stock is maintained.

With our enormous output (resulting in a maximum shop economy), the complete service we render in connection with inquiries, the assistance of our corps of trained experts, together with the excellence of our material, we are able to offer to the discriminating buyer a proposition which will give full value for the money invested.

Instructions for Taking Measurements

WE require but little information, easily obtainable, from which to prepare our drawings; **but what we do need must be given accurately, otherwise the ceiling, when shipped, will not fit.**

Make a simple outline sketch of the shape of the room, not necessarily to scale, and indicate the measurements from point to point, in figures. Subdivided measurements should always equal the total length or width of room.

Make notation of any spaces not to be covered.

It is very necessary that measurements above the top of window and door casings to the ceiling line be given so that a cornice or moulding of proper depth for a desirable finish may be selected.

The windows frequently extend so nearly to the ceiling line in business rooms that only a small cornice, or flat mold, can be used. This information should always be given, and can be indicated as in Figure 2.

Upon application, suggestive drawings and estimates will be prepared and submitted, free of charge, for the approval of the customer.

Kindly indicate preference as to designs or style of ornamentation desired, depth of cornice permissible, and height of ceiling. This will be much appreciated and assist us in the preparation of an artistic arrangement in harmony with your requirements, and of design applicable to the shape of the room.

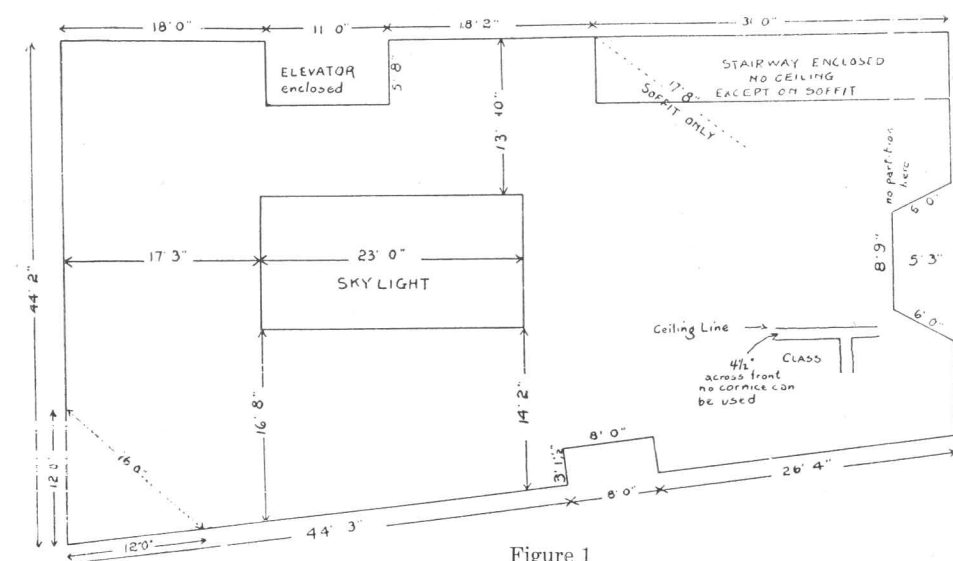

Figure 1

Figure 2

What our Prices are Based on

HE prices for ceiling and wall material are for **special analysis open hearth steel**, painted one good priming coat both sides, including special oval-head nails for the application of the metal only, wood brackets for molding and cornice, properly packed for shipment.

Wood furring strips are never provided for unless specially ordered, then same are charged for extra.

Terms to Responsible Parties

For material only: Thirty days net, or two per cent. for cash within ten days from date of invoice.

For work installed: Net cash on completion.

Delays will be avoided if purchasers will furnish dependable references at time of placing their order.

To parties not responsible: Order should be accompanied with remittance equal to twenty-five per cent. of the value of the purchase, the balance to be subject to our sight draft with bill of lading attached. When this method of payment is desired the purchaser should not fail to state through what bank he desires collection made.

Rules for Estimating Lump Sum Prices

For Ceiling: The area to be charged for is obtained by **adding** twice the vertical height of cornice from bottom of foot mold to the full length and breadth of room, and **multiplying** the length and breadth thus obtained together, making no deduction for any skylight, stairway, or for any other opening or obstruction measuring less than 50 square feet.

Example: If the room measures 20 x 60 feet and a cornice of 12-inch depth is used on both sides and ends of room, add 24 inches to both length and breadth, as follows:

Size of room.....20'0" x 60'0"

Add for 12-inch

Cornice..... 2'0" x 2'0"

22'0" x 62'0" = 13.64 Squares

To compute approximate lump sum price, multiply the number of squares by the proper list price per square of the design selected, which is published in connection with the various sizes

of rooms. Cornice Mitres and Mitre Leaves are not included in design list prices and must be figured extra at their respective list prices and added to the price of Ceiling material as follows:

13.64 squares at \$9.00 per square.....\$122.76

4 only 12-inch Cornice Mitres at
75 cents each..... 3.00

Total List Price.....\$125.76

This estimate is based on a plain rectangular room 20 x 60 feet without any exposed beams, or other irregularities, which might change quantity of material and list price of design.

Rooms which are sub-divided by one or more exposed beams will require more material and cornice mitres and take a higher list price per square. Each space or sub-division should be figured as individual rooms, using list prices applicable to such size spaces; then add sufficient quantity of material to cover exposed sides and bottoms of beams and figure same at their individual list prices.

For Sidewall and Wainscoting: The area charged for is obtained by multiplying the belt measurement of the room by height from base of foot mold on cornice to baseboard, making no deductions for any openings measuring less than 25 square feet, nor for larger openings more than for whole sheets saved.

In computing this class of work the contractor must make provisions in his price for loss of material from wastage, etc.

Rules for Billing Material Sold at a Discount from List

Ceiling, sidewall, and wainscoting plates, dados, borders, and fillers are sold by the square foot.

Cornices and moldings by the lineal foot.

Cornice mitres, mitre leaves, and connections by the piece.

Center pieces and ornaments by the piece when made solid.

Rules for Billing Material Sold at a Net Price per Square

Figure all plates, cornices, moldings, etc., at their actual individual covering area, and stiling or filler at its full width, thus saving the loss in underlapping.

Directions for Applying Berloy Metal Ceiling and Sidewall

Before commencing the application of material, verify all measurements and study carefully working plan.

Working Plans: Proper working plans are supplied, which are prepared from information and measurements furnished. If incorrect information is furnished in the matter of measurements, location of stairways, skylights, or other obstructions, discrepancies will occur, for which we will not be responsible.

Our plans will show in detail the exact location of every piece of material. It is very important that the constructor carefully study the working drawings, and same should be thoroughly understood before commencing the work.

Leveling of Joists: With a straight-edge it can be determined whether furring down or leveling is necessary. This may be accomplished by nailing to the side of joists a strip of necessary thickness, or by setting wedges, as may be required, after ceiling furring strips have been leveled.

It is absolutely essential that furring strips lengthwise and crosswise of the room are centered exactly to the center of nailing points on ceiling plates.

From both ends of the room at points indicated on working plan as "starting line," strike a chalk line; this establishes a starting line from which to work.

For Continuous Ceilings: Use the following rule for placing of wood furring strips; to wit: Place the first wood strip on starting line, and parallel to the same place additional strips 12 inches on centers for plates of 6 or 12-inch multiple, and for such 24-inch multiple plates which are not sufficiently rigid to carry their own weight without buckling or sagging. For all other 24-inch multiple plates strip 24 inches on centers. Cross-furring or headers must be inserted at the end of each plate whether same be furnished in 2, 4, or 8-foot lengths. This method of furring excels methods formerly practiced, because it provides a solid foundation or backing for all nailing points and requires a less quantity of strips; also reduces to a mini-

mum the labor required in the application of the materials.

Furring should always be placed at right angle with joists; cross-furring or headers parallel with joists.

Should wood strips be furnished in connection with metal ceilings, the necessary amount required will be based on the above method of construction.

For Panel Ceilings (Sunken Panels): Parallel to the first strip placed on "starting line" through the room, place additional strips according to the width of panels used. Cross-furring strips or headers must be placed at the end of each panel or last multiple thereof. For example, if the panels are in sheets 4 or 8 feet long, cross-furring is necessary at the end of sheet only. Furring strips lengthwise and crosswise the room are to be centered exactly on the center of nailing points in ceiling panels or plates.

Cornices and moldings are to be applied with the use of wood brackets furnished for that purpose, as shown by working drawings; one wood bracket to every 4-foot section of cornice or molding, and extra brackets for mitres and connections. Brackets are used under laps only.

All cornices and moldings should be applied to a chalk line so that the finished work may be absolutely straight and accurate.

Nail the foot of the cornice in position before nailing the top edge, so as to provide for the underlapping of filler if necessary. Stamped mitres for inside and outside corners are furnished for certain coves and cornices, and can be used for right-angle mitres only. Stamped mitre leaves for inside and outside corners are furnished for certain coves and cornices, and may be used for irregular-angle mitres.

For certain coves and cornices both stamped mitres and leaves are furnished. For all other coves and cornices the ceiling constructor will make or cope the necessary mitres as the work proceeds. Working plans always indicate width of border, molding, filler, and projection of cornice, and this will guide the constructor in spacing furring strips to receive same.

Constructional Drawing of Ceiling and Sidewalls

Strike a chalk line in center of strip or "starting line" for guidance in placing the plates or panels perfectly straight and true.

Always commence the application of material at rear of room and work forward, when possible.

Metal Sidewalls: The foregoing rules also govern in the application of metal sidewall material, for which furring strips are required when the work is done over plaster or studding; we, however, recommend the use of close sheathing for all continuous plates. When sunken panels are used, furring strips must be used of a size to carry the depth of panel.

If metal wainscoting is used, this should be applied first, then such other material as working plan calls for to make the finish above wainscoting.

Care should be taken to keep the work straight and true.

Sufficient allowance for cutting, underlapping, and wastage will be provided for. An extra

charge will be made for any additional material required on account of incorrect information or measurements.

Wood Furring Strips

Furring strips of 7/8 x 7/8-inch size are very satisfactory when working over plaster, but experienced ceiling constructors, when working over joists or studding, prefer 7/8 x 1 1/4-inch size; they are less liable to split, and provide a rigid foundation for the nailing of metal; especially is this true when toe-nailing headers or cross-furring in position.

Wood furring strips are never provided for unless specifically ordered; then same are charged for extra, because users of this class of material can usually purchase, in their own city or vicinity, the necessary furring strips at satisfactory prices and save freight charges.

Wood furring strips of 7/8 x 1 1/4 inches weigh about 18 pounds per 100 lineal feet.

Decorative Suggestions

HE color scheme of the rooms in which we live or work has an important bearing upon our comfort, happiness and health. The most pleasing and cheerful rooms are always those that have been painted in harmonious and inspiring colors. Many otherwise beautiful metal ceilings fail in their decorative purpose because conflicting colors are used or the color scheme selected is not in harmony with the rest of the room or its furniture or fixtures. The ceiling and sidewalls cannot be treated independently without destroying the harmony of the room.

Choice of Colors

Seeming Effect on Dimensions of Rooms

In selecting a color scheme, it is well to bear in mind that certain colors have a curious effect upon the dimensions of a room. Red walls, for example, make a room look smaller. Blue, yellow, tan, gray and pink seem to increase its size. Green (unless very dark) and brown (unless very light) keep the walls "well in place" and have no apparent effect upon their dimensions.

The Possibilities of Color Combinations

Generally speaking, green is restful and soothing, dark blue depressing, and red stimulating; but when used in judicious combination with certain other colors, quite different effects may be obtained. Blue with green or certain tones of yellow is pleasing, while red walls in a dark room will so absorb the light as to make the room gloomy. Green is warm or cold according to the proportion of blue or yellow of which it is composed. Pure yellow is the most sunshiny color in existence.

If the ceiling is too high to be in good proportion to the size of the room, the ceiling color should be brought down to the bottom of the cornice. This will give a drop ceiling effect and apparently lower the ceiling. On the other hand, if the ceiling is very low the sidewall color should be carried well up onto the cornice and blend into the ceiling color.

Very tasteful and delicate effects may be obtained by combinations of old rose or grayish blues or grayish greens.

Colors with enough black in them to give a grayish tone make easily blended and harmonious effects.

Tans, greens and browns usually harmonize, as do blues and grays.

Green and red contrast agreeably, while red and orange clash.

Do not attempt the use of a number of colors, as the difficulties of combination increase with the number of colors. Always avoid the bold striping of moldings, cornice or parts of other members; also eliminate, as much as possible, gaudy colors and the use of gold or silver bronze as these have a tendency to detract from the dignified appearance of the ceiling.

Choose Colors According to Location of Rooms

Discrimination should be shown in the choice of colors for rooms in different locations. Grays, blues, greens and soft browns are especially good where there is plenty of sunlight, but grays and blues are too "cold" for rooms with northern exposure. Greens, tans and warm browns are good where there is less sunlight, and yellows and tans are needed to brighten up the sunless north rooms. In other words, the sunny rooms must have colors that soften the glare and warmth, while dark rooms need warm, bright tones.

Finish—Flat or Gloss

The most satisfactory and by far the prettiest finish is the dead or flat finish now so popular. This flat paint or enamel possesses the quality of bringing the lines of "Berloy" Metal ceilings into harmonious relief, giving a beautiful plastic effect, not otherwise obtainable, at a reasonable cost. Flat paint is comparatively new and, in spite of the fact that it is steadily growing in popularity, there are many people who do not understand what it really is.

Good flat paints are regular oil finishes, but do not produce the glossy appearance which gives that "cold" look to a room. They radiate light instead of absorbing it or throwing a harsh glare into your eyes.

All of the leading paint manufacturers make a flat finish paint that is washable with ordinary soap and water, and inasmuch as Berloy Metal ceilings and sidewalls can be washed without injury to the metal, this soft, velvety finish is the more appropriate. It is really the essential finish to bring out the quiet and luxurious charms of our Period designs in a pleasing and effective manner.

White gloss enamel is appropriate for kitchens, bath rooms or hotels where frequent washing is the rule and a sanitary appearance is required. Appropriate patterns should be selected, which will permit of securing the best results through the use of this gloss finish. Such patterns are the flat designs with shallow panel plates or very simple ornamentation.

How to Paint Preparation

Before applying any paint make sure that the surface to be treated is in proper condition to receive the coating; that all dirt and grease have been removed; and if any slight openings are noticeable after the first coat of paint has been

applied, they should be closed up securely by the painter or decorator, before applying the second or finishing coat, using cement, plaster of Paris or crack filler for that purpose.

Berloy Metal ceilings and sidewalls are painted by a brush process, receiving one coat of lead and oil paint of a light gray color before shipment. In some instances where dark colors are used they can be finished with one additional coat. However, most ceilings and walls are painted some light shade to give more light and cheerfulness to the room. Two coats are then necessary to give the proper finish. Two or three thin coats of paint are much better than one thick coat.

Paints Not to Use

Do not confuse calcimine or cold water paints with the regular finish flat paints. Cold water paints and calcimine should never be used on metal ceilings as they are undesirable and will not give you satisfactory results. Your ceilings are an important part of your building and if the right kind of paint is used and properly applied, you will have a decorative effect very pleasing and of which you may well be proud.

A Perfect Fire Retardant

An official fire test was made at the Columbia University Fire Testing Station, Greenpoint, Brooklyn, N. Y., November 11, 1914, under the auspices of the fire underwriters, for the purpose of determining the comparative fire-resisting qualities of steel and wood-and-plaster ceilings. Metal ceilings resisted 1,369° Fahr. for 1 hour and 10 minutes (which was as long as the test lasted). Wood-lath-and-plaster ceilings, on the other hand, collapsed in 12 minutes although exposed to only 849°.

In other words, metal ceilings can be counted upon remaining in place from 5 to 6 times as long as a wood-lath-and-plaster ceiling.

The advantages of Metal Ceilings over wood and plaster are obvious. They give perfect protection against fire, water, dust, vermin and rodents, do not crack and collapse and never shrink or warp.

Metal Ceilings and Sidewalls completely satisfy the demand for a non-combustible,

decorative and durable interior finish for all buildings of the higher type, whether public, churches, theaters, court houses, business blocks, stores, shops, etc., or private residences, garages, etc.

The favor with which Berloy Metal Ceilings are regarded in this country and abroad has stimulated us to higher artistic efforts. Architects, builders and owners who desire the most artistic and durable finish for the interiors of their buildings will be sure to appreciate and profit by our endeavors.

The growth and development of the metal ceiling industry proves that the public has been prompt to appreciate and utilize the advantages of ceilings and sidewalls which are ornamental in design, perfect in construction, and combine safety with durability and satisfactory service. Not only does this hold good with new buildings, but the protest of the public is further expressed in the thousands of lath-and-plaster ceilings which are annually being replaced with Berloy Metal Ceilings and Sidewalls.

Special Attention Given to the Appropriate Treatment of Interiors of Churches, Halls, Theaters, Auditoriums, Etc.

(See Installations on Pages 12 to 22)

We have a full series of appropriate patterns and trimmings for all types of buildings in the prevailing style of architecture.

In many instances the construction of a Berloy Metal Ceiling has greatly improved the acoustic properties of Churches, Halls, Auditoriums, etc.

Our designers are at your command, and submission drawings with estimates are furnished gratuitously to interested parties. Every proposition, regardless of its magnitude, is given careful attention in the selection of patterns and trimmings, and the most desirable arrangement of same, for best results and the most artistic effect.

For an estimate, send complete diagram of ceiling with measurements given as accurately as possible. State the height of ceiling and distance above doors and windows.

If metal wall finish is desired, make complete diagram of each wall and measure accurately. Show location and size of doors and windows by giving necessary measurements.

What is the architectural style of your building?

ILLUSTRATIONS

on the preceding page represent the finished plates which can be made up from the parts shown on this page.

We recommend that plates Nos. 4047, 4048 and 4049 be ordered when 4, 5, 6, 7 and 8-foot lengths are to be used.

The No. 4050-A, B and C series should be specified when longer than 8-foot lengths are required as same can be made any length desired by using one or more plates. No. 4050-B (which is furnished in 4, 6 and 8-foot lengths), in connection with No. 4050-A or C top or bottom finisher.

BERLOY BUILDING MATERIALS

Metal Lumbar

This is a system of joists and studs of pressed steel. Punched out prongs provide for the easy attachment of metal lath or $\frac{3}{8}$ -inch Ribplex.

Metal Lumbar is supplied from stock, cut to length at the factory and carefully scheduled on working drawings.

Metal Lumbar offers freedom from plaster cracks, binding of doors and windows and similar trouble.

It is Strong, Light in Weight and Fireproof.

Floor Cores

These pressed steel forms permit rapid and economical construction of T-beam concrete floors in spans up to 30 feet to carry loads up to 200 pounds per square foot. They are made of 26 and 22 gauge steel. The latter are the removable type. The use of Floor Cores means an effective concrete floor construction with big reductions in the cost of labor and material.

Three-fourths-Inch Ribplex

This is an expanded metal lath with ribs $\frac{3}{4}$ -inch high, spaced 4.8 inches on centers.

It is widely used as centering and reinforcement for concrete roofs, walls, partitions and floors.

The strong ribs and stiff mesh permit wide spacing of supports and make a very substantial and economical fireproof construction.

Three-eighths-Inch Ribplex

This is the ideal lath for all straight away work, walls, ceilings, partitions and stucco.

The ribs $\frac{3}{8}$ -inch high and spaced 8 inches on centers make the sheets very strong and stiff.

The small on-edge mesh gives added stiffness and affords a perfect clinch with plaster.

Three-eighth-inch Ribplex is easy to apply, easy to plaster against, permits wide spacing of studs and makes a strong, fire-resistive construction at about the same cost as for ordinary metal lath of the same weight.

Expanded Metal Lath

This Diamond Mesh Lath is a well-known standard product in the building trade. It offers a reinforcement in every direction for plaster and stucco and makes a fire-resistive construction.

Berloy Expanded Metal Lath has been widely used for straight run lathing and for the forming of coves, false work and the like; it is indispensable.

BERLOY STEEL OFFICE AND FACTORY EQUIPMENT

Filing Case

The Berloy line of filing equipment includes vertical cases for the filing of correspondence, checks, invoices, documents and, in fact, all business papers; steel transfer units for the holding of inactive correspondence; book storage cases; card index files; storage shelving; horizontal files.

Our complete catalog goes into details and shows illustrations of the various numbers. We invite you to write for it as you will find it full of information of value in selecting proper equipment for your office.

Berloy Steel Bins and Shelving provide the ideal equipment for stock storage, in factories, department stores, garages and, in fact, all lines of a business where any quantity of stock is carried on hand.

They are adjustable to meet the varying changes in quantities of stocks carried and, therefore, save much space. They can be taken down, moved and reassembled without loss of parts. Naturally they are fire-retardant as they offer no food for flames.

Our complete catalog will give you full particulars and our engineers will at your suggestion lay out a proper installation to take care of your particular needs.

Bins and Shelving

Berloy Steel Clothes Lockers are essential equipment of any modern institution. We make them in different sizes and styles for use in factories, offices, business buildings, clubs, mines, stores, etc. They offer a safe, sanitary and economical method of taking care of personal effects and clothing. Our engineers have planned and installed these Lockers in many of the most prominent institutions in the country and their experience is available to you.

Our catalog illustrates fully the various types of Lockers including what is known as the Berloy Utility Cabinet, a most useful steel cabinet for the storage of stationery, books, tools, automobile supplies, clothing, etc. We will be glad to send this catalog to those interested.

WE ISSUE INDIVIDUAL CATALOGS COVERING THE ABOVE PRODUCTS AND IN MAKING REQUESTS KINDLY MENTION WHICH PRODUCT INTERESTS YOU SO THAT THE RIGHT CATALOG CAN BE SENT.
